

1. Main Components Inside a Desktop PC

1. Motherboard – Connects all computer components and allows them to communicate.
2. CPU (Processor) – Executes instructions and performs calculations.
3. RAM – Temporarily stores data and programs currently in use.
4. HDD/SSD – Stores the operating system, applications and personal files.
5. Power Supply Unit (PSU) – Supplies electrical power to the computer components.
6. GPU/Graphics Card – Processes graphics and sends the display output to the monitor.
7. CPU Cooler – Removes heat generated by the CPU.
8. Case Fans – Provide airflow and help keep components cool.
9. Optical Drive – Reads CDs/DVDs, if installed.
10. CMOS Battery – Maintains BIOS/UEFI settings and system time.

2. PC Disassembly Steps

1. Shut down the PC and unplug the power cable.
2. Disconnect all external cables and peripherals.
3. Remove the side panel of the computer case.
4. Disconnect the power cables from the motherboard and components.
5. Remove the GPU and other expansion cards if installed.
6. Remove the RAM modules carefully.

7. Disconnect and remove the HDD/SSD.
8. Disconnect the CPU cooler and remove it carefully.
9. Remove the motherboard from the case if required.
10. Keep all screws and components safely organized.

Take a photo after each major step and add a short caption explaining what was done.

3. PC Reassembly Steps

1. Install the motherboard into the case.
2. Install the CPU and CPU cooler.
3. Install the RAM modules into the correct slots.
4. Install the HDD/SSD.
5. Install the GPU or other expansion cards.
6. Connect the motherboard power cables.
7. Connect storage and front-panel cables.
8. Check that all components and cables are properly connected.
9. Close the side panel and reconnect external cables.
10. Turn on the PC and check that it boots successfully.

The order is important because components must be securely installed and connected before powering on the system.

4. Safety Precautions and Tools Checklist

Safety Precautions

- Shut down and unplug the PC before working.
- Keep liquids away from the computer.
- Work on a clean, dry and stable surface.
- Avoid touching component contacts and pins.
- Hold RAM and expansion cards by their edges.
- Keep screws organized.
- Do not force any component into a slot.
- Make sure all power connections are secure before switching on the PC.

Tools Required

- Phillips-head screwdriver
- Anti-static wrist strap
- Small container for screws
- Soft brush or compressed air for dust
- Good lighting

These precautions help prevent electric shock, static-electricity damage and physical damage to computer components.
