

1. Draw a labeled diagram of a desktop pc

- Motherboard
- CPU
- RAM
- GPU
- HDD
- SSD

2.create a comparison table showing the main differences between HDD and SSD.

Feature	HDD	SSD
Speed	Slower	Faster
Durability	Less durable because it has moving parts	More durable because it has no moving parts
Typical use	Large storage , backups, desktop PCs	Laptops ,gaming PCs, fast boot and apps
Cost	Cheaper per GB	More expensive per GB
Noisi	Makes some noise	Silent
Technology	Uses spinning magnetic disks	Uses flash memory

3. Write a short explanation about the role of CPU , RAM , AND GPU in running games like pubg or free fire on a pc.

Role of CPU, RAM , and GPU in gaming

1. CPU(processor): The CPU handles the main game calculations, such as player movement, game logic , and physics. A good CPU helps the game run smoothly without lag.
2. RAM(memory): RAM temporarily stores the data that the game is currently using. More RAM helps the PC run the game smoothly while handling other programs at the same time.
3. GPU: The GPU renders graphics, textures, lighting, and visual effects. A powerful GPU helps provide higher graphics quality and smoother gameplay.

4.PC upgrade for latest FIFA

I would consider upgrading these hardware components:

GPU: Upgrade to a more powerful graphics card to improve graphics quality and maintain smooth frame rates.

CPU: A faster processor can improve game performance and handle game calculations more efficiently.

RAM: Increasing RAM helps the game run smoothly, especially when other applications are open.

SSD: Installing the game on an SSD can reduce loading times compared with an HDD.

Cooling System: Better cooling can help the CPU and GPU maintain stable performance during long gaming sessions
